DANGER
Carbon Monoxide

Using a generator indoors WILL KILL YOU IN MINUTES.

Carbon Monoxide

Generator exhaust contains high levels of carbon monoxide (CO), a poisonous gas you cannot see or smell. If you can smell the generator exhaust, you are breathing CO. But even if you cannot smell the exhaust, you could be breathing CO.

· NEVER use a generator inside homes, garages, crawlspace, or other partly enclosed areas. Deadly levels of carbon monoxide can build up in these areas. Using a fan or opening windows and doors does NOT supply enough fresh air.

· ONLY use a generator outdoors and far away from open windows, doors, and vents. These openings can pull in generator exhaust.

Even when you use a generator correctly, CO may leak into the home. ALWAYS use a battery-powered or battery-backup CO alarm in the home.

If you start to feel sick, dizzy, or weak after the generator has been running, move to fresh air RIGHT AWAY. See a doctor. You could have carbon monoxide poisoning.
Preface

Thank you for using our generator.

This manual includes the operation and maintenance of the GG3000D

All information in this publication is based on the latest product information available at the time of approval for printing. We reserve the right to make changes at any time without notice and without incurring and obligation. The copyright of this manual belongs to our company. No parts of this publication may be reproduced without written permission.

This manual should be considered a permanent part of the generator and should remain with it if it is resold.

Pay special attention to statements preceded by the following words:

⚠️ WARNING

It indicates a strong possibility of severe personal injury or death if instructions are not followed.

⚠️ CAUTION

It indicates a strong possibility of severe personal injury or death if instruction is not followed.
If a problem should arise, or if you have any questions about the generator, consult an authorized dealer.

⚠️ BE CAREFUL

The generator is designed to give safe and dependable service if operated according to instructions, read and understand the Owner’s manual before operating the generator. Failure to do so could result in personal injury or equipment damage.
Safety Instruction

⚠️ WARNING!

The generator is designed to give safe and dependable service if operated according to instructions. Read and understand this manual carefully before operating the generator or it may cause serious injury and equipment damage.

⚠️ WARNING!

Exhaust contains poisonous carbon monoxide. Do not operate generator in confined environment or with an aerator. Only use outdoors and far from open windows doors and vents.

⚠️ WARNING!

The muffler becomes very hot during operation and remains hot for a while after stopping the engine. Be careful not to touch the muffler while it is hot. Let the engine cool before storing the generator indoor. The engine exhaust system will be heated during operation and remains hot immediately after stopping the engine. To prevent scalding, pay more attention to the warning marks attached to the generator.

⚠️ BE CAREFUL!

Do not parallel connect other cables to receptacles, use special jack, or it may cause an electrical shock.
Safety Instruction

⚠️ WARNING!

- Gasoline is extremely flammable and is explosive under certain conditions. Refuel in a ventilated area with engine stopped.
- Keep away from cigarette, smoke and sparks when refueling the generator. Always refuel in a well-ventilated location.

⚠️ WARNING!

- Connection for standby power to a building electrical system must be made by a qualified electrician. The connection must isolate the generator from utility power, and must comply with all applicable laws and electrical codes. Improper connections to a building electrical system can allow electrical current from the generator to back feed into the utility lines. Such back feed may electrocute utility company workers or others who contact lines during a power outage and the generator may explode, or cause fires when utility power is restored.

⚠️ WARNING!

To avoid accidents and equipment damage, check generator system every time before starting engine.
- Keep the generator a distance of at least 1 meter from other equipment during operation.
- Keep the generator horizontal when running. If generator tilts, it may cause fuel spillage.
- Generator operators must be trained, must know how to stop the generator quickly and understand the operation of all controllable parts. Untrained operators should not be allowed to use this equipment.
- Keep children and pets away from operation area.
- Keep away from rotating parts during operation.
- The generator is a potential source of electrical shock when misused. Do not operate it with wet hands or in any wet location. Do not operate the generator in rain or snow. Do not allow unit to get wet.

WARNING!
Read this manual carefully before using the machine, for your own safety.

1 COMPONENT IDENTIFICATION

1. Fuel cap
2. Air vent knob
3. Choke knob
4. Control panel
5. Starting grip
6. Fuel valve grip
7. Maintenance covers
8. AC socket
9. Overload indicator light
10. Output indicator light
11. Oil alert indicator light
12. Eco throttle switch
13. Engine switch
14. DC socket
15. DC circuit breaker
16. Grounding terminal
SMART THROTTLE

Engine speed is kept at idle automatically when the electrical appliance is disconnected and it returns to the proper speed to power of the electrical load when electrical appliance is connected. This position is recommended to minimize the fuel consumption while in operation.

2. SAFETY INSTRUCTIONS.

- The generator is designed to give safe and dependable service if operated according to instructions.

- Read and understand the Owner’s Manual before operating the generator. Failure to do so could result in personal injury or equipment damage.

- Exhaust gas contains poisonous carbon monoxide. Never run the generator in an enclosed area. Be sure to provide adequate ventilation.

- The muffler becomes very hot during operation and remains hot for a while after stopping the engine. Be careful not to touch the muffler while it is hot. Let the engine cool before storing the generator indoors.

- The engine exhaust system will be heated during operation and remains hot immediately after stopping the engine. To prevent scalding, pay attention to the warning marks.

- Gasoline is extremely flammable and explosive under certain conditions. Refuel in a well-ventilated area with the engine stopped.

- Keep away from cigarette smoke and sparks when re-fueling the generator. Always refuel in a well ventilated location.

- Wipe up spilled gasoline at once.

- Connections for standby power to a building’s electrical system must be made by a qualified electrician and must comply with all applicable laws and electrical codes. Improper connections can allow electrical current from the generator to back feed into the utility lines.
3. SAFETY LABEL LOCATIONS

These labels warn you for potential hazards that can cause serious injury. Read the labels and safety notes and precautions described in the manual carefully. If a label comes off or becomes hard to read, contact your dealer for a replacement.

PRE-OPERATION CHECK

⚠️ Be sure to check the generator on a level surface with the engine stopped.

4.1 Check the engine oil level

⚠️ Using non-detergent oil or 2-stroke engine oil could shorten the engine’s service life.
Use high-detergent, premium quality 4–stroke engine oil, certified to meet or exceed U.S. automobile manufacturer’s requirements for API Service Classification SG. SF.(15W40)

Select the appropriate viscosity for the average temperature in your area.

Loosen the cover screw and remove the left side maintenance cover. Remove the oil filler cap, and wipe the dipstick with a clean rag. Check the oil level by inserting the dipstick in the filler hole without screwing it in.

⚠️ If the oil level is below the end of the dipstick, refill the recommended oil up to the top of the oil filler neck.

The Oil Alert System will automatically stop the engine before the oil level falls below the safe limit. However, to avoid the inconvenience of an unexpected shutdown, it is still advisable to visually inspect the oil level regularly.
4.2 Check the fuel level

Turn the fuel cap lever to “OFF” position before transporting.
Use automotive fuel (Unleaded or low leaded is preferred to minimize combustion chamber deposits).
!! Don’t use fuel-containing alcohol. Fuel system damage or engine performance problems resulting from the use of fuels that contain alcohol are not covered under the warranty.

Never use an oil/gasoline mixture or dirty gasoline.
Avoid getting dirt, dust or water in the fuel tank.
After refueling, tighten the fuel filler cap securely.

Gasoline is extremely flammable and is explosive under certain conditions.
Refuel in a well-ventilated area with the engine stopped.
Do not smoke or allow flames or sparks in the area where the engine is refueled or where gasoline is stored.
Do not overfill the fuel tank. After refueling, make sure the tank cap is closed properly and securely.
Be careful not to spill fuel when refueling. Spilled fuel or fuel vapor may ignite. If any fuel is spilled, make sure the area is dry before starting the engine.
Avoid repeated or prolonged contact with skin or breathing of vapor. KEEP OUT OF REACH OF CHILDREN

4.3 Check the air cleaner.

Check the air cleaner element to be sure it is clean and in good condition.
1. Loosen the cover screw and remove the left side maintenance cover.
2. Press the latch tab on the top of the air cleaner body, remove the air cleaner cartridge, and check the element.
3. Clean or replace the element if necessary.
Never run the engine without the air cleaner. Rapid engine wear will result from contaminants. Such as dust and dirt, being drawn through the carburetor, into the engine.

It is normal for a little oil to appear under the air filter box if the generator is running for a long period of time, or a lot of oil is in the engine. Wipe up excess oil after each use and after stopping the generator.

GENERATOR USE

5.1 Starting the engine

⚠️ Before starting the engine, disconnect any load from the DC receptacle. Turn the fuel cap lever fully clockwise to the ON position.

2. Set the fuel valve in the “ON” —position.
3. Choke (Type 1) To start a cold motor slide the choke lever all the way to the left. To restart a hot motor set the choke lever halfway.
Choke (Type 2) To start a cold motor pull out the choke completely to close. To restart a hot motor, press the choke completely to open.

Choosing the right choke position is the key to starting the motor. You may have to practice a few times to use the choke correctly.

Slide the choke completely to the right to restart a hot motor.
Slide the choke to about halfway to restart a warm motor.

⚠️ A hot motor will not start if there is too much fuel in the cylinder. If this happens, wait five to ten minutes before trying again. Slide the choke completely to the right and the motor should start.

4. Set the motor switch to the “ON” position.

5. Pull slightly on the start cord until you feel resistance and then pull hard and swiftly.

⚠️ Do not let the start cord retract by itself: guide it back by hand. Hold the carrying handle firmly to prevent the generator from falling over when you pull the start cord.
6. After the engine starts, allow the engine to run continuously to warm up.
7. Slide the choke in completely after the engine is started.

⚠️ If the engine stops and will not restart, check the engine oil level before troubleshooting in other areas.

⚠️ Before using the device once it is connected, switch off the ECO switch.

5.2 High altitude operation

At high altitude, the standard carburetor air–fuel mixture will be excessively rich. Performance will decrease, and fuel consumption will increase.

Even with suitable carburetor jetting, engine horsepower will decrease approximately 3.5% for each 300m (1,000 feet) increase in altitude.

⚠️ Operation of the generator at lower altitude than the carburetor is jetted for may result in reduced performance, overheating, and serious engine damage caused by an excessively lean air/fuel mixture.
Operation of the generator at lower altitude than the carburetor is jetted for may result in reduced performance, overheating, and serious engine damage caused by an excessively lean air/fuel mixture.

5.3 Generator use

5.3.1 WARNING!

- To prevent electrical shock from faulty appliances, the generator should be grounded. Connect an electric conductor (cable) of at least 1.5mm to 2mm between the generator’s ground terminal and an external ground source.
- Connections for standby power to a building’s electrical system must be made by a qualified electrician and must comply with all applicable laws and electrical codes. Improper connections can allow electrical current from the generator to back feed into the utility lines. Such back feed can cause damage or even electrocute once utility power is restored.
- Do not exceed the current limit specified for any one receptacle.
- Do not connect the generator to a household circuit. This could cause damage to the generator or to electrical appliances in the house.
- Do not modify or use the generator for other purpose than it is intended for. Also observe the following when using the generator.
  - Do not connect generators in parallel. —Do not connect an extension to exhaust pipe.
  - When an extension cable is required, be sure to use a shielded flexible cable.
  - Limit length of extension cables; 60m for cables of 1.5mm2 and 100m for cables of 2.5mm2.
  - Keep the generator away from other electric cables or wires such as distribution network.
  - The DC receptacle can be used while the AC power is in use. If you use both at the same time, be sure not to exceed the total power for AC and DC.

Most appliance motors require more than their rated wattage for start-up.

5.4 AC applications

1. Start the engine and make sure the output indicator light (green) illuminates.
2. Confirm that the appliance to be used is switched off, and plug in the appliance.

Substantial overloading that continuously lights the overload indicator light (red) may damage the generator. Marginal overloading that temporarily lights the overload indicator light (red) may shorten the service life of the generator. Be sure that all appliances are in good working order before connecting them to the generator, if an appliance begins to operate abnormally, becomes sluggish, or stops suddenly, turn off the generator engine switch immediately. Then disconnect the appliance, and examine it for signs of malfunction.
5.5 Output and Overload indicators.
The output indicator light (green) will remain lighted during normal operating conditions. If the generator is overloaded or if there is a short in the connected appliance, the output indicator light (green) will go OFF, the overload indicator light (red) will go ON and current to the connected appliance will be shut off.
Stop the engine if the overload indicator light (red) switches ON and investigate the overload source.

⚠️ Before connecting an appliance to the generator, check that it is in good order, and that its electrical rating does not exceed that of the generator. Then connect the power cord of the appliance, and start the engine.

Be sure all equipment is turned off before plugging in the power cord.

When an electric motor is started, both the overload indicator lights (red) and the output indicator light (green) may go on simultaneously. This is normal if the overload indicator light (red) goes off after about four seconds.
If the overload indicator light (red) stays on, consult your dealer.
Connect the ground terminal.

Start engine according to “STARTING THE ENGINE” section.
When the output indicator light (green) does not light and the overload indicator light (red) lights instead, set the engine switch to STOP, stop the engine at once and then start the engine again.

3. Confirm that the equipment to be used is switched off, and insert the plug of the equipment to be used into the AC receptacle unit A.

⚠️ Check that the equipment to be connected is switch off. When the equipment to be used is switched on, it will operate suddenly, and injuries or accidents may be caused.

4. Switch on the equipment, output indicator light will be ON. In case of overload operation or when trouble occurs for the equipment being used, the output indicator light (green) will go out, the overload indicator light (red) will light continuously, and no power will be put out. At this time, the engine will not stop, so that the engine must be stopped by setting the respective engine switch to STOP.

⚠️ When equipment requires a large starting power, the overload indicator lights (red) and the output indicator light (green) may light together for a short time, but this is no abnormality. After start of the equipment, the overload indicator light (red) will go out and the output indicator light (green) will stay lit.

</tr>
</tbody>
</table>

5.6 DC applications
For charging 12V automotive batteries:
The generator cannot sense a sensibility load with the same power, which the manual indicates. It only can sense 40%-70% power, which the manual indicates.
The generator cannot sense a sensibility load with the same power which the manual indicates. It only can sense 40%-70% power which the manual indicates.

Example:

<table>
<thead>

</tr>
</tbody>
</table>

- When using the DC output, turn Smart Throttle to the OFF position. The DC current will be below 5A if turning on the Smart Throttle without AC current output.
- When charging batteries, person must be present to monitor the voltage. Stop charging when the voltage of the batteries is above 16V. Or it may cause battery explosion, resulting in serious injury or death.

- To prevent the possibility of creating a spark near the battery, connect charging cable first to the generator, then to the battery. Disconnect cable first at the battery.
- Before connecting charging cables to a battery that is installed in a vehicle, disconnect the vehicles grounded battery cable. Reconnect the vehicle’s grounded battery cable after the charging cables are removed. This procedure will prevent the possibility of short circuit and sparks if you make accidental contact between a battery terminal and the vehicle’s frame or body.
- Do not attempt to start an automobile engine while the generator still connected to the battery. The generator may be damaged.
- Connect the positive battery terminal to the positive charging cord. Do not reverse the charging cables, or serious damage to the generator and/or the battery may occur.
- The battery gives off explosive gases; Keep spark, flames and cigarettes away. Provide adequate ventilation when charging.
- The battery contains acid (electrolyte). Contact with skin or eyes may cause severe burns. Wear protective clothing and a face shield.
- If battery acid gets on your skin, flush with water.
- If battery acid gets in your eyes, flush with water for at least 15 minutes and call a physician.
- If swallowed, drink large quantities of water or milk and follow with milk of magnesia or vegetable oil and call a physician.
- **KEEP OUT OF THE REACH OF CHILDREN, PETS AND UNTRAINED PEOPLE.**
5.7 Start the engine
• The DC receptacle may be used while the AC power is in use.
• An overloaded DC circuit will trip the DC circuit protector. If this happens, disconnect the DC load before resetting circuit protector to resume operation.

5.8 Oil alert system
• The oil alert system is designed to prevent engine damage caused by insufficient amount of oil in alert system will automatically shut down the engine (the engine switch will remain in the ON position).
• If the oil alert system shuts down the engine, the oil alert indicator light (red) will come on when you operate the starter, and the engine will not run. If this occurs, add engine oil.

5.9 Stopping the engine

To stop the engine in an emergency, turn the engine switch to the OFF position.
In normal use:
1. Switch off the connected equipment and pull the inserted plug out.
2. Turn the engine switch to the OFF position

3. 2. Turn the lever fully counter clockwise to the “OFF” position

⚠️ Be sure to tighten the fuel cap and the engine switch is in the “OFF” position when stopping, transporting and/or storing the generator.
6 MAINTENANCE

- The purpose of the maintenance and adjustment schedule is to keep the generator in the best operating condition.
- Inspect or service as scheduled in the table below.

⚠️ Shut off the engine before performing any maintenance. If the engine must be running, make sure the area is well ventilated. The exhaust contains poisonous carbon monoxide gas.

⚠️ Use authorized parts or their equivalent. The use of replacement parts which are not of equivalent quality may damage the generator.

**WARNING!** If the temperature of external environment reaches or higher than 45°, the generator sets should be stopped working, otherwise, the generator sets will be damaged.

**WARNING!** If the temperature of external environment reaches or lower than -5°, the generator sets can not be started.

6.1 Changing oil
Drain the oil while the engine is still warm to assure rapid and complete draining.

⚠️ Make sure to turn the engine switch and the fuel cap vent lever OFF before draining.

1. Lean the generator.
2. Fasten the oil lead pipe on the oil drain plug as the picture. Then drain out the oil.
3. Refill the new oil and check the oil position in the crankcase.
4. After refilling the new oil into the crankcase, move the generator from left to right to make sure the bobber of the oil alarm system is floating.

Engine oil capacity: 0.9 L
Wash your hands with soap and water after handling used oil.

⚠️ Please dispose of used motor oil in a manner that is compatible with the environment. We suggest you take it in a sealed container to your local service station for reclamation. Do not throw it in the trash or pour it on the ground.

6.2 Air cleaner service

A dirty air cleaner will restrict airflow to carburetor. To prevent carburetor malfunction,
Service the air cleaner regularly. Service more frequently when operating the generator in extremely dirty areas.

⚠️ Do not use gasoline or low flash point solvents for cleaning. They are flammable and explosive under certain conditions.

Loosen the cover screw and remove the access panel.
Remove the screw under the air filter case.
Pull the air filter cartridge down 30mm and remove the air filter cartridge.
Remove the air filter iron clip and check the air filter element. Clean or replace the element if necessary.
Reinstall the air filter parts after cleaning or replacing air filter element.

6.3 Spark plug servicing

Please use high quality authentic spark plug.
To ensure proper engine operation, the spark plug must be properly gapped and free of deposits.
1. Remove bolts from the top of the maintenance cover.

![Top maintenance cover](image)

Take out the ignition coil rubber boot.

![Ignition coil rubber boot](image)

Remove the spark plug with spark plug wrench.

![Spark plug wrench](image)

Screwdriver

Insert the screwdriver into the hole of the spark plug wrench and remove the spark plug.
Visually inspect the spark plug. Discard it if the insulator is cracked or chipped. Clean spark plug with a wire brush if it is to be reused.

5. Install the spark plug carefully by hand, to avoid cross threading.
6. After a new spark plug has been seated by hand, it should be tightened 1/2 turn with a wrench to compress its washer. If a used plug is being reinstalled, it should only require 1/8 to 1/4 turns after being seated.
7. Reinstall the ignition coil rubber boot on the spark plug securely.
8. Reinstall the control panel.

⚠️ The spark plug must be securely tightened. An improperly tightened plug can become very hot and possibly damage the generator.
Never use a spark plug with an improper heat range.
Never use a spark plug without damping resistance, or it will cause no AC output.

7 TRANSPORTING AND STORAGE

To prevent fuel spillage when transporting or during temporary storage, the generator should be secured upright in its normal operating position, with the engine switch OFF.
The fuel cap vent lever is turned counter clockwise to the OFF position.
Allow the engine to cool well before turning the fuel cap vent lever to the OFF position.

7.1 When transporting generator:
• Do not overfill the tank.(There should be no fuel in the filler neck).
• Do not operate generators while it is on a vehicle. Take the generator off the vehicle and use it in a well-ventilated place.
• Avoid a place exposed to direct sunlight when putting the generator on a vehicle. If the generator is left in an enclosed vehicle for many hours, high temperature inside the vehicle could cause fuel to vaporize resulting in a possible explosion.
• Do not drive on a rough road for an extended period with the generator on board. If you must transport the generator on board. If you must transport the generator on a rough road, drain the fuel from the generator before hand.
7.2 Before storing the unit for an extended period:
1. Be sure the storage area is free of excessive humidity and dust.
2. Drain the fuel.

⚠️ Gasoline is extremely flammable and explosive under certain conditions. 
Do not smoke or allow flames or sparks in the area.

2. Completely drain the fuel from the tank. Open the fuel valve, start the engine and operate it in the idle position until all remaining fuel is gone and the engine stops automatically.

4. Drain oil.
5. Remove spark plug and fill cylinder with 2cc’s fresh oil. Pull start motor 3-4 times to discharge the remaining oil. Then reinstall the spark plug.
6. Pull the starting cord slowly until resistance is strong. At this time, the piston is moving to the top of the compression stroke and the valves will be closed.
Spark Arrestor service
Un-cleaned muffler will make noise and affect the engine’s operation.
Clean and maintain the Spark Arrestor timely, make sure the generator works normally.
The Spark Arrestor needs cleaning frequently if you use the generator in very dirty conditions, or replace the Spark Arrestor if necessary.

⚠️ Careful

- Before cleaning the Spark Arrestor make sure generator is OFF.
- Before doing maintenance on the Spark Arrestor, make sure the machine is cool.

1. Remove the M6 screws and open the muffler cover.
2. Remove two M4 screws on the Spark Arrestor
3. Take down the Spark Arrestor as per the following figure.
4. Check the Spark Arrestor, clean or replace it if necessary.
8 TROUBLESHOOTING

Engine will not start:
- Check fuel level

- Is the engine switch and fuel valve “on”? Turn them to the “on” position

- Enough lubricating oil? Add recommended oil if necessary.

- Is there fuel in the carburetor?

- Spark plug works or not? Replace spark plug

Send the generator to an authorized service dealer if the generator still does not start or call 866-896-6881 toll free

- Shake the generator several times to make the float rise if the generator cannot start after adding oil for the first time and the oil alarm indicator stays on when pulling the starting grip.
- Make sure there is no spilled fuel around the spark plug. Spilled fuel may ignite.
- If the engine still doesn’t start, have the generator repaired by a licensed repair person.

INSPECTION:
1. Remove the spark plug rubber boot and clean any dirt from around the spark plug
2. Remove the spark plug and place it in the spark plug rubber boot.
3. Connect the side electrode of the spark plug to the metal parts of the engine.
4. Pull the starting cord. A spark could jump across the gap.
Specification

9.1 Size and weight
Type: GG3000D
L x W x H: 21.8 x 12 x 19.488
Net weight kg/lbs: 26/57

9.2 Engine
Model: 157F
Type: 4-stroke OHV 1-Cylinder
Displacement (cc): 150
Compression ratio: 9.2:1
Engine speed: 5400rpm (ECO switch is off)
Cooling system: Forced air cooling
Ignition system: TDI
Oil capacity (L): 0.70
Fuel tank capacity (L): 7
Spark plug: NGK (4629 C7HSA)
Noise level: 94 dB(A)
Continuous operation: 5.5h

9.3 Generator
Type: GG3000D
Rated voltage (V): 230
Rated frequency (Hz): 50
Rated current (A): 18/16/8.7
Rated output (KVA): 2
Rated voltage (V): 12
Rated current (A): 8.3
